An example of project objectives for a group-based FYP project. Each group project must define both **project objectives** (shared by both students) and **module objectives** (specific to each student).

Below is an example based on the **"Biometric-Based Voting System"** project:

Project Title: Biometric-Based Voting System

Project Objectives (shared by both students):

1. To develop a secure and efficient voting system using biometric authentication.
2. To prevent duplicate voting and ensure one-person-one-vote verification.
3. To securely store and manage voter data while maintaining privacy and integrity.

Module Objectives:

For Student 1 – Biometric Registration and Voter Authentication System

1. To identify existing biometric authentication techniques in voting systems through literature review.
2. To design and develop a voter registration system that captures biometric data (fingerprint, facial recognition, or voice recognition).
3. To test the accuracy and efficiency of biometric authentication for voter verification.

For Student 2 – Voting Operations and Data Management

1. To identify secure methods for vote recording, tallying, and data management through literature review.
2. To design and develop a voting system that ensures real-time vote counting and secure storage.
3. To test the security and integrity of vote storage and result display.

By clearly separating each student's objectives in group-based projects, we can ensure fair evaluation and avoid situations where one student does more work than the other. This also helps students stay accountable and focused, as they can always refer back to their own objectives.

Supervisors don't need to write these objectives for them but should guide them in defining a clear scope. For projects assigned to two students, we need to ensure that the proposed titles allow for a fair division of work, with a scope that is realistic and manageable within the given timeframe.
